The **Commutative Law** allows you to switch the order of the terms you are performing an operation on.

For addition:

$$a + b = b + a$$

For multiplication:

$$a \times b = b \times a$$

The Associative Law allows you tells us that how we group things doesn't matter.

For addition:

$$(a+b) + c = a + (b+c)$$

For multiplication:

$$(a \times b) \times c = a \times (b \times c)$$

The **Distributive Law** allows you to multiply a number into a larger term, or pull out a common factor form a few terms.

$$a \times (b+c) = a \times b + a \times c$$
